tional spin chains at higher rank : solution, completeness, separation of variable

Rational spin chains with GL(N) symmetry of higher rank and their supersymmetric generalisation became of increased importance recently due to their relation to the AdS/CFT integrable system. We will discuss recent advances in their systematic study, in particular we show novel ways to explicitly solve Bethe equations and to prove their completeness, and introduce separation of variables for these systems.

Bibliothèque du LPTHE, tour 13/14, 4ème étage
