A Smooth Exit from Eternal Inflation ?

I discuss recent work with Bobev, Conti and Vreys in which we evaluate the partition function of the free $O(N)$ vector model on a two-parameter family of squashed three spheres and in the presence of a mass deformation. The thermodynamics of this system turns out to be qualitatively similar to that of generalisations of the AdS Taub-NUT and Taub-Bolt solutions of Einstein gravity coupled to a scalar field. Recent formulations of dS/CFT enable one to interpret this partition function as the Hartle-Hawking wave function in a minisuperspace model consisting of anisotropic deformations of inflationary universes. I derive the resulting holographic measure in this model, which has a regime of eternal inflation. This measure indicates that the exit surface from scalar field driven eternal inflation is much smoother than what conventional wisdom about eternal inflation says.

Institut Henri Poincaré, salle 314, 3^{ème} étage
