Titre : *Scrambling in Nonlocal Random Quantum Circuits*

Orateur : **Lorenzo Piroli (Max-Planck-Institute of Quantum Optics)**

Résumé : *I will give an overview of recent results in the study of quantum chaos in random unitary quantum circuits. After providing the main motivations coming from high-energy physics, I will introduce the concepts of out-of-time ordered correlators (OTOCs) and of tripartite information as measures of scrambling of quantum information. I will then focus on the study of nonlocal random circuits, and discuss a method to obtain numerically exact results for large system sizes. I will finally present a detailed study of two particular systems : a Brownian SYK model of all-to-all-interacting Majorana fermions, and a random circuit model for black hole evaporation, focusing on the most interesting physical aspects.*
