IHES, Amphithéâtre Léon Motchane(Séminaire Géométrie et groupes discrets)

Domaines : math

Titre : *Rational Approximations to Linear Subspaces*

Orateur : **Nicolas De Saxcé (CNRS & Université Paris-Nord)**

Résumé : *Dirichlet's theorem in Diophantine approximation implies that for any real x , there exists a rational p/q arbitrarily close to x such that $|x - p/q| < 1/q^2$. In addition, the exponent 2 that appears in this inequality is optimal, as seen for example by taking $x = \sqrt{2}$. In 1967, Wolfgang Schmidt suggested a similar problem, where x is a real subspace of $\mathbb{R}^d$ of dimension ℓ , which one seeks to approximate by a rational subspace v . Our goal will be to obtain the optimal value of the exponent in the analogue of Dirichlet's theorem within this framework. The proof is based on a study of diagonal orbits in the space of lattices in $\mathbb{R}^d$.*
