Local conformal field theory from long-range perturbation theory

Conformal field theory (CFT) plays a crucial role in understanding phase transitions, whether quantum or statistical. CFTs can be studied using perturbative methods, such as the 4-epsilon expansion and the large N expansion. In this talk, I will introduce an alternative approach : a fixed-dimensional perturbation theory that incorporates long-range, non-local interactions. I will demonstrate that by imposing the conformal Ward Identity, it is possible to recover the data of local CFTs. By re-summing the perturbative series using long-range solitons (solutions to the nonlinear equation of motion with fractional Laplacian), we obtain nice results for the critical exponents.

Institut Henri Poincaré, salle 314, 3^{ème} étage
