IHES, Amphithéâtre Léon Motchane(Séminaire Géométrie et groupes discrets)

Domaines : math

Titre : *Diophantine Approximation and Random Walks on the Modular Surface*

Orateur : **Timothee Benard** (CNRS & Université Paris-Nord)

Résumé : *Khintchine's theorem is a key result in Diophantine approximation. Given a positive non-increasing function f defined over the integers, it states that the set of real numbers that are f -approximable has zero or full Lebesgue measure depending on whether the series of terms $(f(n))n$ converges or diverges. I will present a recent work in collaboration with Weikun He and Han Zhang in which we extend Khintchine's theorem to any self-similar probability measure on the real line. The argument involves the quantitative equidistribution of upper triangular random walks on $SL(2,R)/SL(2,Z)$.*
