Titre : *New Construction of Eigenstates and Separation of Variables for $SU(N)$*

Orateur : **Fedor Levkovich-Maslyuk (ENS - Paris)**

Résumé : “*Integrability meeting ENS/IPhT*”

(Based on arXiv :1610.08032)

We present a new way to construct eigenstates of integrable XXX quantum spin chains with $SU(N)$ symmetry which bypasses the nesting procedure. The states are built by repeatedly acting on the vacuum with a single operator $B_{\text{good}}(u)$ evaluated at the Bethe roots. Our proposal serves as a compact alternative to the usual nested algebraic Bethe ansatz. Furthermore, the roots of this operator give the separated variables of the model, explicitly generalizing Sklyanin’s approach to the $SU(N)$ case. We present many tests of the conjecture and prove it in several special cases. We focus on rational spin chains with fundamental representation at each site, but expect that our main results are valid more generally.
