Titre : *Scalar products of Bethe vectors in the algebraic Bethe ansatz*

Orateur : **Nikita Slavnov** (**Steklov Mathematical Inst. of Russian Academy of Sciences, Moscow**)

Résumé : “*Integrability meeting ENS/IPhT*”

We consider a problem of Bethe vectors scalar products of the models solvable by the (nested) algebraic Bethe ansatz. For the models with $gl(2)$ symmetry or its q -deformation, the scalar products can be calculated straightforwardly via the standard arguments of the algebraic Bethe ansatz. However, for the models with higher rank symmetry, the technical complexity of such a calculation increases immensely. We suggest a new method based on the coproduct properties of the Bethe vectors. We illustrate this method by the example of the scalar products in the $gl(2)$ based models.
