Titre : *Supersymmetric field theories on curved spaces from string theory*

Orateur : **Daniël Prins (IPhT)**

Résumé : *Supersymmetric field theories can be defined on curved spaces by coupling them to an off-shell supergravity background. Recently, it was shown how the requirements for such $d=4$ field theories can be obtained from string theory by examining supersymmetric D3-branes without worldvolume flux. I will discuss how to fully embed $N=1$ backgrounds in string theory and give examples. I will also discuss how this picture generalizes to the case of D3-branes with worldvolume flux and how this is related to field theories with non-linear supersymmetry on curved spaces.*
