Séminaire de Physique Nucléaire Théorique

Nuclear structure and reactions using lattice effective field theory

G. Rupak

(Department of Physics and Astronomy, Mississippi State University, USA)

Effective field theory (EFT) formulated on a space-time lattice provides a model-independent framework for ab initio nuclear structure and reaction calculations. The EFT interactions are rooted in quantum chromodynamics through low energy symmetry constraints. In this talk I present several recent developments in lattice EFT. I present the so called adiabatic projection method that enables elastic and in-elastic reaction calculations. Bound state properties of atomic nuclei such as carbon and oxygen will also be presented.
