Titre : *Analytics from Numerics : Planar Two-Loop Five-Point QCD Amplitudes*

Orateur : **Ben Page** (IPhT, Saclay)

Résumé : *Two-loop scattering amplitudes are a vital component in high-precision cross section calculations at the LHC. At higher multiplicities, the increased number of scales can make the algebra of analytic amplitude calculations intractable. In this talk, we discuss how to apply numerical techniques to sidestep this intermediate complexity and combine them with physical properties of the amplitude to efficiently determine its analytic form. In particular we focus on planar five-point amplitudes in QCD.*
