Titre: Entanglement enhanced metrology with quantum many-body scars

Orateur: Shane Dooley (Trinity College, Dublin)

Résumé: Thermalisation is almost inevitable in any sufficiently large and complicated quantum many-body system, leading to the destruction of any multipartite entanglement between its components. However, quantum many-body scars are special energy eigenstates that can prevent thermalisation, even in a quantum chaotic system. Although the scars themselves can have high multipartite entanglement, in most examples considered so far the dynamics has involved states that either have no entanglement, or have a very simple entanglement structure. Here we consider a physically motivated modification of the Hamiltonian that generates a variety of multipartite entangled states through the dynamics in the scar subspace. We show that these states can be exploited for entanglement enhanced quantum metrology.
